

3 3/8" Mechanical Speedometer High Performance EV Line Part Number R5441

This is a mechanical speedometer, which indicates the speed of the vehicle in miles per hour. The speedometer has a cable connector of 5/8-18 UNF-2A thread. Install the speedometer in the dash using mounting clamp supplied, and connect the drive cable to the speedometer. Ensure the proper engagement of cable with the speedometer. This speedometer has a main odometer and a trip odometer each of which indicates the distance in miles. The trip odometer can be reset to zero miles by rotating the knob in the clockwise direction.

Caution: This knob should not be rotated in the counterclockwise direction.

Connect the lamp terminals to the dash illumination switch.

Warning: The speedometer is fitted with three 12-volt lamps at factory. If the Electrical system of the vehicle is 24-volt, replace the 12-volt lamps with 24-volt lamps (provided in kit).

To replace the lamps, rotate the lamp holders in counterclockwise direction (using pliers or by hand) and remove them. The lamp can then be removed from the holder. Insert the appropriate voltage lamp in the socket. The lamp holder can be fitted in the speedometer in the reverse order of removal.
